Product & AI Engineering Recruitment Team

ClickPost Technologies

Bangalore, Karnataka, India

Subject: Application for AI Engineer - Internship Position

Dear ClickPost AI & Product Engineering Team,

ClickPost's mission as the post-purchase intelligence platform turning logistics complexity into a competitive advantage for 450+ global retailers—processing 50M+ shipments monthly across 600+ carriers while building the enterprise agentic layer for exception resolution, voice agents, and lost sale recovery—represents the exact caliber of high-scale, applied AI engineering I aspire to build. As a Computer Science and Engineering undergraduate at Bannari Amman Institute of Technology (CGPA: 8.28/10), I am eager to join ClickPost in Bangalore as an AI Engineer Intern to turn AI prototypes, internal automations, and LLM experiments into production services.

My engineering experience directly aligns with ClickPost's stack and focus areas. In architecting **PatentIQ**, I engineered an **autonomous AI agent** workflow leveraging the **Model Context Protocol (MCP)** and dynamic **tool calling**, dynamically orchestrating vector retrieval tools, patent claim parsers, and external research APIs. Furthermore, I built a low-latency **RAG** pipeline utilizing local **LLMs (Qwen2.5 via Ollama)** and Pinecone vector embeddings to automate unstructured text analysis, semantic claim overlap, and quantitative risk scoring, backed by a Clean Architecture Fastify/PostgreSQL backend with strict schema validation. Complementing this, in **DB Backup CLI (DBVault)**—published to npm and Docker Hub with **120 automated tests**—I engineered distributed job scheduling using **Redis and BullMQ**, enforcing worker concurrency, rate-limits, and Redis-based distributed locking to guarantee zero data loss.

ClickPost's culture of ownership, speed, and continuous learning strongly mirrors my software craftsmanship. In my merged contribution to **ESLint Core (PR #21218)**, I resolved intricate IEEE 754 binary64 floating-point underflow edge cases in AST static analysis, authoring comprehensive regression test suites that passed **43 automated CI verification checks**. Backing this rigor, I have solved **1200+ algorithmic problems** across LeetCode, CodeChef, and GeeksforGeeks, and hold verified credentials including IIT Madras / NPTEL's *The Joy of Computing using Python* (**Elite + Topper, Top 5%, 95% score**), **Oracle Cloud Certified Foundations Associate**, and **AWS Cloud Practitioner Essentials**. As a Web Developer with Students Special Group, I built full-stack portals and faculty analytics dashboards while mentoring **50+ students**.

I am passionate about shipping applied AI that solves messy real-world problems. I would welcome the opportunity to build ClickPost MCP servers, develop operational AI copilots, design rigorous evals, and deploy reliable LLM decision-making workflows at logistics scale. Thank you for your time, consideration, and review of my application.

Sincerely,

Rithish S
